Publishers

Supporting **data must be made available** to editors and peer reviewers at the time of submission for the purposes of evaluating the manuscript. All manuscripts reporting original research published in Nature journals **must include a data availability statement** ...

Earth, space and environmental sciences

From January 2019, where community repositories are available, **we will require data sharing** through such repositories [...].

Where such repositories are not available, datasets may be hosted in general data repositories such as Figshare, Dryad or Zenodo.

<https://www.nature.com/authors/policies/availability.html>
<https://www.nature.com/nature-research/editorial-policies/reporting-standards>

Publishers

All data used in the analysis **must be available** to any researcher for purposes of reproducing or extending the analysis. Data must be available in the paper, deposited in a community special-purpose repository, accessible via a general-purpose repository such as Dryad, or otherwise openly available.

Climate and Earth and Space Sciences data.

Guidelines on data deposition are provided by the **Coalition on Publishing Data in the Earth and Space Sciences (COPDESS)**, together with a searchable online **Repository Finder**.

<https://www.sciencemag.org/authors/science-journals-editorial-policies#data-deposition>

Publishers

Copernicus Publications **requests depositing data** that correspond to journal articles in reliable (public) data repositories, assigning digital object identifiers, and properly citing data sets as individual contributions.

Data policy

The output of research is not only journal articles but also data sets, model code, samples, etc. Only the entire network of interconnected information can guarantee integrity, transparency, reuse, and reproducibility of scientific findings. Moreover, all of these resources provide great additional value in their own right. Hence, it is particularly important that data and other information underpinning the research findings are "findable, accessible, interoperable, and reusable" (FAIR) not only for humans but also for machines.

Therefore, Copernicus Publications requests depositing data that correspond to journal articles in reliable (public) data repositories, assigning digital object identifiers, and properly citing data sets as individual contributions. Please find your appropriate data repository in the registry for research data repositories: **re3data.org**. A data citation in a publication resembles a bibliographic citation and needs to be included in the publication's reference list. To foster the accessibility as well as the proper citation of data, Copernicus Publications requires all authors to provide a statement on the availability of underlying data as the last paragraph of each article (see section **data availability**). In addition, data sets, model code, video supplements, video abstracts, International Geo Sample Numbers, and other digital assets should be linked to the article through DOIs in the assets tab. With **Earth System Science Data (ESSD)** Copernicus Publications provides a journal dedicated to the publication of data papers, including peer review of data sets. Authors should consider submitting a data paper to ESSD in addition to their research paper in another journal published by Copernicus Publications.

Best practice following the **Joint Declaration of Data Citation Principles** initiated by FORCE 11: ▶

COPDESS

In addition to promoting these data citation principles, Copernicus Publications is a signatory of the **Coalition on Publishing Data in the Earth and Space Sciences (COPDESS) commitment statement** and the **Enabling FAIR Data Commitment Statement in the Earth, Space, and Environmental Sciences**.

FAIR data Guiding Principles

To be **F**indable:

F1. (meta)data are assigned a globally unique and eternally persistent identifier.

F2. data are described with rich metadata.

F3. (meta)data are registered or indexed in a searchable resource.

F4. metadata specify the data identifier.

To be **A**ccessible:

A1 (meta)data are retrievable by their identifier using a standardized communications protocol.

A1.1 the protocol is open, free, and universally implementable.

A1.2 the protocol allows for an authentication and authorization procedure, where necessary.

A2 metadata are accessible, even when the data are no longer available.

To be **I**nteroperable:

I1. (meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation.

I2. (meta)data use vocabularies that follow FAIR principles.

I3. (meta)data include qualified references to other (meta)data.

To be **R**e-usable:

R1. meta(data) have a plurality of accurate and relevant attributes.

R1.1. (meta)data are released with a clear and accessible data usage license.

R1.2. (meta)data are associated with their provenance.

R1.3. (meta)data meet domain-relevant community standards.

Enabling Findable, Accessible, Interoperable and Reusable Data

in the earth, space, and environmental science

Researchers understand and follow expectations related to data management and metadata of the publication

Scientific repositories are valued for stewardship, data access, improving peer review and digital product quality

Publishers set standards and follow best practice related to datasets, metadata, accepted repositories and data citation

Abstract

We provide a set of grid files that collectively allow recreating a 3D geological model which covers the Upper Rhine Graben and its adjacent tectonic domains, such as portions of the Swiss Alps, the Black Forest and Vosges Mountains, the Rhenish Massif and the Lower Rhine Graben. This publication is a complement to the publication of Freymark et al. (2017).

Molasse

Abstract

Accordingly, the provided structural model consists of (i) 14 sedimentary and volcanic units; (ii) a talline crust composed of seven upper crustal units and a lower crustal unit; and (iii) two lithospheric mantle units. The files provided here include information on the regional variation of these geological units in terms of their depth and thickness, both attributes being allocated to regularly spaced grid nodes with horizontal spacing of 1 km.

The model has originally been developed to obtain a basis for numerical simulations of heat transport, to calculate the lithospheric-scale conductive thermal field and assess the related geothermal potentials, in particular for the Upper Rhine Graben (a region especially well-suited for geothermal energy exploitation). Since such simulations require the subsurface variation of physical rock properties to be defined, the 3D model differentiates units of contrasting materials, i.e. rock types. On that account, a large number of geological and geophysical data have been analysed (see Related Work) and we shortly describe here how they have been integrated into a consistent 3D model (Methods). For further information on the data usage and the characteristics of the units (e.g., lithology, density, thermal properties), the reader is referred to the original article (Freymark et al., 2017). The contents and structure of the grid files provided here-with are described in the Technical Info section.

Dataset Description

Supplement to

Freymark, Jessica; Sippel, Judith; Scheck-Wenderoth, Magdalena; Bär, Kristian; Stiller, Manfred; Fritsche, Johann-Gerhard; et al. (2017): The deep thermal field of the Upper Rhine Graben. *Tectonophysics*. 10.1016/j.tecto.2016.11.013

Additional Information

We acknowledge Landesamt für Geologie, Rohstoffe und Bergbau (LGRB; Baden-Wuerttemberg) for kindly allocating the digital datasets of the GeORG model and the geological 3D model of Baden-Wuerttemberg.

Methods

The presented 3D structural model is the result of an extensive data integration process. In a first step, we visualized and collectively analysed geological maps, smaller-scale 3D structural models, depth and thickness maps, drilled formation tops and interpreted seismic horizons (See Related Works) using the software Petrel (©Schlumberger). After identifying the main lithological units to be differentiated by the intended 3D model and correcting for inconsistencies between the layers, the scattered information on the top surface elevation of the units was interpolated to obtain regular grids with a horizontal element spacing of 1 km (Convergent Interpolation algorithm of Petrel). More details about the original datasets (e.g., their regional extents, sources etc.) used to model the topology of the structural horizons are listed in the Supplementary Material 1 of Freymark et al. (2017).

In order to mitigate insufficient coverage of the region with deep seismic profiles revealing the internal

Abstract
This dataset contains subsurface geophysical data from the Northern Adriatic area (Italy) organized in a 3D environment. In particular, it includes 60 (2-D) multichannel seismic reflection profiles made public by the Italian Ministry of the Economic Development in the framework of the ViDEPI project (Visibility of petroleum exploration data in Italy), georeferenced and organized into the Move® software (Midland Valley) environment. The full description of the data and methods is provided in the data description file.

Software

what to include in your paper

Availability Statement

1. State **where the version of your software used for your research is preserved**
2. Optionally: Include the GitHub URL or other development platform URL (Note: GitHub is not a preservation resource)

Citation

1. Include in the References Section of your paper the citation to **where your software is preserved**. For GitHub users, there is an integrated connection to Zenodo

Methodology

1. Describe how your software works as it pertains to your research

From: Stall, Shelley, Townsend, Randy, & Robinson, Erin. (2020, April). The Paper and The Data: Authors, Reviewers, and Editors Webinar on Updated Journal Practices for Data (and Software). Zenodo. <http://doi.org/10.5281/zenodo.3744660>

Software citation methods

- Cite the software itself via **software domain repository** (e.g. Computational Infrastructure for Geodynamics (CGI), Hydroshare),
- Cite the **software journal** (e.g. JOSS) where the software is described **AND the repository where it is preserved**,
- Cite the **general repository supporting software preservation** that provides registration services for a digital object identifier (e.g. Zenodo).

From: Stall, Shelley, Townsend, Randy, & Robinson, Erin. (2020, April). The Paper and The Data: Authors, Reviewers, and Editors Webinar on Updated Journal Practices for Data (and Software). Zenodo. <http://doi.org/10.5281/zenodo.3744660>

Software

Avoid these incorrect citations resources:

- **GitHub**
- **SourceForge**
- **BitBucket**
- **GitLab**
- **Personal/Institution Page**

Software Citation Checklist for Authors

- Have I identified the software, including my own, which makes a **significant and specialized contribution to my academic work**, and therefore should be cited?
- Have I checked if the software has a **recommended citation from the creators** and used it if available? If this is to a paper, have I also cited the software directly?
- Have I created **as complete a citation as possible** if no recommended citation is given?
- Have I **referenced the software appropriately in my academic work**, in compliance with any citation formatting guidelines?

Software Citation Checklist for Authors (Version 0.9.0). Zenodo. <https://doi.org/10.5281/zenodo.3479198>

Software Citation – Elements

Does the citation include...

1. who created the software, contributed, designed, tested – including usability tests,
2. when it was created,
3. the title of the software (and version if available) and
4. where the software can be accessed (preferably via a persistent identifier to an archival repository)?

kvos/CoastSat: CoastSat v1.0.1

Kilian Vos; Kristen Splinter; Chris Leaman; ianlturner

CoastSat is an open-source software toolkit written in Python that enables users to obtain time-series of shoreline position at any coastline worldwide from 30+ years (and growing) of publicly available satellite imagery. There are three main functionalities:

- assisted retrieval from Google Earth Engine of all available satellite images spanning the user-defined region of interest and time period
- automated extraction of shorelines from all the selected images using a sub-pixel resolution technique
- intersection of the 2D shorelines with user-defined shore-normal transect

Changes from previous release

- new functions to label images and train your own image classifier

ORCID ID

 <https://orcid.org/0000-0001-7342-9789>

- The **Open Researcher and Contributor ID** distinguishes you from every other researcher.
- ORCID connects all your research outputs to your person.
- Use “Auto-update” (for Crossref, Datacite, etc.) http://bit.ly/ORCID_Trust

ORCID

Identifiers are the foundation of the FAIR Research Data Ecosystem.

Lehnert et al., 2020, Digital Data Infrastructure for Physical Samples: The IGSN and the Internet of Samples, GeoUtrecht2020 virtual conference

Contributors

With “contributor” you have the possibility to acknowledge additional persons or institutions related to the dataset but which you would normally not mention as authors. These are not named in the citation, but always related with the dataset and searchable as all the other metadata fields.

Descriptions

Type	Description

Data Manager: Person (or organization with a staff of data managers, such as a data centre) responsible for maintaining the finished resource. The work done by this person or organization ensures that the resource is periodically "refreshed" in terms of software/hardware support, is kept available or is protected from unauthorized access, is stored in accordance with industry standards, and is handled in accordance with the records management requirements applicable to it.

Contributors

With “contributor” persons could not mention related work

Descriptions

Type

DataCurator	Person tasked with reviewing, enhancing, cleaning, or standardizing metadata and the associated data submitted for storage, use, and maintenance within a data center or repository	While the “DataManager” is concerned with digital maintenance, the DataCurators’ role encompasses quality assurance focused on content and metadata. This includes checking whether the submitted dataset is complete, with all files and components as described by submitter, whether the metadata is standardized to appropriate systems and schema, whether specialized metadata is needed to add value and ensure access across disciplines, and determining how the metadata might map to search engines, database products, and automated feeds.
DataManager	Person (or organization with staff of data managers, such as a data centre) responsible for maintaining the finished resource.	The work done by this person or organization ensures that the resource is periodically “refreshed” in terms of software/hardware support, is kept available or is protected from unauthorized access, is stored in accordance with industry standards, and is handled in accordance with the records management requirements applicable to it.
Distributor	Institution tasked with responsibility to generate/disseminate copies of the resource in either electronic or print form.	Works stored in more than one archive/repository may credit each as a distributor.
Editor	A person who oversees the details related to the publication format of the resource.	Note: if the Editor is to be credited in place of multiple creators, the Editor’s name may be supplied as Creator, with “(Ed.)” appended to the name.
Funder	Institution that provided financial support for the development of the resource.	Recommended for discovery. Includes organizations that provide funding via regular budget allocations, through grants or awards
HostingInstitution	Typically, the organization allowing the resource to be available on the internet through the provision of its hardware/software/operating support.	May also be used for an organization that stores the data offline. Often a data centre (if that data centre is not the “publisher” of the resource.). There may be two hosting institutions if the data or work is stored in both.
Producer	Typically a person or organization responsible for the artistry and form of a media product.	In the data industry, this may be a company “producing” DVDs that package data for future dissemination by a distributor.
ProjectLeader	Person officially designated as head of project team or subproject team instrumental in the work necessary to development of the resource.	The Project Leader is not “removed” from the work that resulted in the resource; he or she remains intimately involved throughout the life of the particular project team.
ProjectManager	Person officially designated as manager of a project. Project may consist of one or many project teams and sub-teams.	The manager of a project normally has more administrative responsibility than actual work involvement.
